

EACH EXTRA LAYER HALVES

Fictional Paper Screen team • draft poster • 18 September 2026

THE SENSOR VALUE!

$$160 \times 2^{-4} = 10$$

at four layers, IF exact halving holds

BUT OUR FIRST RECORD SAID 20

That is 10 units above the model prediction.

We want a controlled retest before calling it dependable. These are invented arbitrary units.

LOOK AGAIN

Who made this poster, and who is its audience?

Which number is a model prediction? Which is a record?

What does the small-print limit change?
